SIH 2026 / INDEPENDENT PROTOTYPE REVIEW

Human flaws, evidence and jury review

FDR-Setu + AICTE Institution Complaint Monitoring

Prepared for: Purva Gawali | SE Mechanical, NMIET
Review consolidated: 25 October 2026 | **Version:** 1.0

Access confirmed: both websites and the reviewed demo screens were accessible. This report consolidates read-only observations. No records, documents, approvals, case dispositions or notifications were changed.

Principal finding

Both prototypes expose substantial workflow detail. Their operational credibility depends on whether an officer can identify the correct record, interpret evidence correctly, recognize a blocker and perform only an authorized action. Those controls have not been established merely by displaying dashboards, badges or action buttons.

The three clearest observed findings

- **Wrong-record context:** a Kalinga search in FDR-Setu changed the results but retained Pragati's selected FDR and action controls.

- **Score explanation mismatch:** a complaint institution profile displayed 100/100 although the visible contributions summed to 96.

- **Evidence ambiguity:** complaint attachments labelled Verified PDF did not explain the verification scope in the inspected view; FDR document displays also contained integrity-presentation anomalies.

How to read this report

Observed: visible in the reviewed interface. **Reproduced:** a UI behaviour was deliberately followed and confirmed. **Risk:** a plausible human error, not a proven incident. **Untested:** requires controlled tests, real integration evidence or backend access.

The 14-person panel is a simulated review structure: one advocate, one opponent and 12 stakeholder perspectives. It is not a survey, a real jury vote, an official AICTE audit or a certification. Severity expresses reviewer judgment about plausible consequence, not measured incident frequency.

02 / COMPLETE REVIEW REGISTER

FDR-Setu: observed concerns

Each entry separates the visible finding from the possible human consequence and the limit of the evidence.

F01 | Task and vocabulary overload

Observed / High. Evidence: Ten main navigation areas, specialist vocabulary, multiple filters and eight detail tabs distribute the assessment task.
Human consequence: An occasional officer may prioritize a score or familiar action instead of the required check.
Limit: Task difficulty and error frequency have not been measured with users.

F02 | Filter and selected record diverge

Reproduced / High. Evidence: Kalinga search showed three Kalinga results while the detail panel retained Pragati FDR-2026-0001 and action controls.
Human consequence: The user may act on the previous institution while believing the search changed the target.
Limit: No consequential action or wrong database write was executed.

F03 | Simulation and verification authority can be confused

Observed / High. Evidence: The bank screen discloses simulation, while other screens prominently show Bank-Confirmed and CBS Verified.
Human consequence: A user may interpret a successful simulated match as live bank evidence.
Limit: No live bank integration or independently authenticated reply was validated.

F04 | Instrument state can be mistaken for obligation state

Observed presentation / High risk. Evidence: A college search returned instruments in different states. The architecture links maturity, renewal and coverage-gap escalation.
Human consequence: One matured receipt may be interpreted as institution-wide non-compliance without establishing its obligation.
Limit: The applicable rule and continuity requirement must be checked case by case.

F05 | Checksum display requires correction or explanation

Observed / High credibility concern. Evidence: Both inspected SHA-256 values contain 63 hexadecimal characters rather than the conventional full-width 64.
Human consequence: A technical-looking label may be accepted as proof of file integrity.
Limit: This establishes a display/format anomaly, not actual file corruption; raw files were not hashed.

F06 | Document previews do not clearly distinguish document purpose

Observed / Moderate. Evidence: The FDR copy and lien-letter entries showed the same receipt-style particulars in their previews.
Human consequence: An officer may treat a generic preview as issuer evidence for a different document type.
Limit: Underlying PDFs and document-specific authenticity were not verified.

F07 | Approval, order and completed discharge need distinct meaning

Observed stages / High risk. Evidence: Approved stages, pending discharge, an order preview and technical status-transition controls coexist.
Human consequence: A reviewer may mistake a preview or approved request for an issued/executed instruction.
Limit: No action permissions, issued order, bank discharge or settlement were tested.

F08 | Authoritative policy and performance claims need evidence

Observed / High. Evidence: The interface includes statutory-period/timeline wording and simulated accuracy, turnaround and savings figures.
Human consequence: Configured assumptions or simulation outputs may be repeated as official rules or achieved impact.
Limit: Applicability, calculation methods and production outcomes have not been established.

03 / COMPLETE REVIEW REGISTER

Complaint portal: observed concerns

The presence of an allegation or investigation must not be confused with an established finding of misconduct.

C01 | Verified PDF does not define verification scope

Observed / High. Evidence: Inspected attachments show a Verified PDF badge without a reviewer, method, scope or source in that view.
Human consequence: File validity can be confused with authenticity or substantiation of an allegation.
Limit: The verification backend and original attachments were not inspected.

C02 | Risk total and explanation disagree

Observed / High. Evidence: An institution profile showed 100/100; visible contributions 30 + 24 + 20 + 12 + 10 total 96.
Human consequence: An officer may trust a number that cannot be reproduced from its explanation.
Limit: An omitted contribution could explain the total; either calculation or explanation needs clarification.

C03 | Administrative activity can be read as misconduct

Observed inputs / High risk. Evidence: Risk contributions include open complaints, priorities, multiple bureaus and overlap groups.
Human consequence: Duplicate reporting or wider coordination can inflate apparent concern without new independent evidence.
Limit: Whether the score is intended as workload, attention priority or wrongdoing likelihood is not established.

C04 | Identity exposure requires a tested access model

Observed display / High risk. Evidence: A demo super-admin dossier displays complainant name/contact; records are explicitly dummy.
Human consequence: Sharing case information across bureaus may expose more identity than necessary.
Limit: No real personal-data leak or role-level access defect was established.

C05 | Status differences are described as conflicts

Observed / Moderate-high. Evidence: Overlap explanations cite different processing statuses as parallel/conflicting actions.
Human consequence: Compatible stages may trigger unnecessary coordination or be treated as contradictory decisions.
Limit: True conflict detection and matching accuracy were not measured.

C06 | Linking and merging are combined

Observed / High risk. Evidence: A combined Link & Merge Cases action appears beside lead assignment and coordination controls.
Human consequence: Separate complainants, remedies and evidence could be conflated.
Limit: Merge effects, preservation of originals and reversal were not tested.

C07 | Similarity confidence and coordination completion need proof

Observed / High uncertainty. Evidence: Many groups display 99%; the interface supports lead assignment, threads and false-positive dismissal.
Human consequence: A score can be mistaken for calibrated certainty; assignment may be mistaken for accepted responsibility.
Limit: Model calibration, human approval, notifications and end-to-end ownership were not validated.

C08 | Seed-record consistency and dense assessment screens

Observed / Moderate. Evidence: A reviewed timeline said Transferred from PGRC to PGRC. Register and overlap views contain many controls and nested details.
Human consequence: Inconsistent examples and dense screens can lead to misreading or skipped evidence.
Limit: One inconsistent seed entry does not prove a routing-engine defect; user errors were not measured.

04 / COMPLETE REVIEW REGISTER

Human flaws across both websites

These are failure mechanisms to investigate. They are not claims that any named officer, institution or complainant behaved improperly.

ID	Human factor	Mechanism	Possible consequence
X01	Cognitive overload	Many terms, filters, tabs and nested views compete with the immediate task.	Skipped checks; wrong selection; dependence on training.
X02	Authority confusion	Demo roles, authentication messages and official-looking outputs can appear operational.	Mistaking displayed permission or an order preview for authorization/execution.
X03	Automation bias	Risk percentages, OCR confidence and confirmation badges are visually persuasive.	Accepting a suggestion without checking source, scope or uncertainty.
X04	Confirmation bias	A high institution score may influence interpretation of later evidence.	Treating allegations or duplicate reports as corroboration.
X05	Alert fatigue and deadline pressure	Many alerts and priority scores may compete for attention.	Ignoring important cases or acting quickly to clear a queue. Actual effects unmeasured.
X06	Handoff and accountability gaps	Multiple bureaus, stages and named roles can obscure the next responsible actor.	Assuming another person has verified, accepted ownership or completed the action.

Panel member A: advocate

- FDR-Setu preserves valuable distinctions between submitted, extracted and independently confirmed information; the bank module discloses simulation and the release screen separates stages.

- The complaint portal provides institution consolidation, side-by-side case comparison, lead assignment, coordination threads and false-positive review. These provide a useful basis for validation.

Panel member B: opponent

- The difficult question is whether a tired or inexperienced officer can complete one correct decision without trusting an unexplained score, acting on stale evidence or selecting the wrong record.

- An audit tab, role dropdown, architecture diagram or verification badge demonstrates an interface concept. It does not independently prove the corresponding backend control.

05 / COMPLETE REVIEW REGISTER

Jury register: 01-02

Two stakeholder perspectives per page. Assessments are simulated and evidence-limited.

J01 | New AICTE scrutiny officer

Task: Assess a college and identify the next permitted action.

Observed evidence: FDR-Setu exposes ten main navigation areas, several filters, eight detail tabs and specialist terms such as CBS, provenance and state-machine transition.

Human flaw: A new officer may follow a high score or familiar button before understanding the required evidence check.

Observed concern / interpretation: The inspected route does not reduce the task to one clear issue, source, assigned responsibility and next action.

Untested control: Role guidance, permitted actions and task completion by an unfamiliar officer have not been validated.

Possible consequence: A missed prerequisite or an action taken without understanding its scope.

Assessment: High human-factors concern; complexity was observed, but failure rates were not measured.

Required validation: Ask a new officer to explain the issue, evidence, blocker and next actor without coaching. Record wrong selections, help requests and completion time.

Register links: F01, X01; U01, U02, U13

J02 | College nodal / accounts officer

Task: Understand every pending requirement for one college.

Observed evidence: Searching Pragati in FDR-Setu returned five instruments in different states. The complaint institution profile consolidates open cases, bureaus, officers and recent actions.

Human flaw: A person may treat one instrument status as the entire college's position or submit duplicate evidence because related obligations are unclear.

Observed concern / interpretation: The distinction between separate obligations, historical instruments and replacements needs to be obvious. The complaint profile is a useful consolidation feature.

Untested control: An end-to-end college submission, correction and response journey was not executed.

Possible consequence: Unnecessary submissions, repeated follow-ups or misunderstanding whether a specific requirement is satisfied.

Assessment: Moderate-to-high concern. Consolidation exists in the complaint portal; FDR obligation-level clarity remains to be demonstrated.

Required validation: Give a nodal officer a college with active, replaced and release-pending instruments. Require a correct obligation-by-obligation explanation.

Register links: F01, F04; U02, U04, U13

06 / COMPLETE REVIEW REGISTER

Jury register: 03-04

Two stakeholder perspectives per page. Assessments are simulated and evidence-limited.

J03 | Officer switching between colleges

Task: Move from one institution to another without acting on the previous record.

Observed evidence: Filtering FDR-Setu for Kalinga changed the list to three Kalinga instruments, while the detail panel retained Pragati's FDR-2026-0001 and its controls.

Human flaw: A busy officer assumes that the detail panel follows the newly entered college search.

Observed concern / interpretation: The visible search context and selected-record context can diverge without an adequate interruption.

Untested control: No verification, editing, investigation or transition action was executed against the retained record.

Possible consequence: A remark, flag or decision could be applied to the wrong institution if safeguards do not catch the mismatch.

Assessment: High-priority reproduced interface issue. A wrong database update was not demonstrated.

Required validation: Repeat the filter change, inspect selection behaviour, and test a harmless sandbox action only with authorization. Require an explicit record identity before any consequential action.

Register links: F02; U01, U11

J04 | Student / faculty complainant

Task: Supply evidence safely and understand the progress of a complaint.

Observed evidence: The inspected complaint dossier displayed a complainant name and contact. The session was demo super-admin and the data was explicitly marked dummy.

Human flaw: Officers may overshare identity during coordination; complainants may withhold evidence if they fear exposure or retaliation.

Observed concern / interpretation: Cross-bureau cooperation must not imply unrestricted access to identity and sensitive attachments.

Untested control: Role-specific identity masking, attachment restrictions, safe communication and complainant-facing tracking were not tested.

Possible consequence: Unnecessary exposure, reduced reporting or loss of confidence in complaint handling.

Assessment: High potential impact; no real personal-data leak was established.

Required validation: Use synthetic identities to test a role-access matrix and coordination visibility. Confirm that only necessary information is disclosed.

Register links: C04, X02; U01, U06, U13

07 / COMPLETE REVIEW REGISTER

Jury register: 05-06

Two stakeholder perspectives per page. Assessments are simulated and evidence-limited.

J05 | College representative responding to allegations

Task: Understand and answer allegations without being prejudged.

Observed evidence: The inspected complaint profile displayed 100/100 institutional risk. Its listed contributions were 30, 24, 20, 12 and 10, totaling 96.

Human flaw: A reviewer may treat complaint volume or the number of investigating bureaus as proof of misconduct.

Observed concern / interpretation: Duplicated allegations can increase workload without adding independent evidence. The displayed score needs a consistent explanation.

Untested control: Score calibration, duplicate adjustment, challenge/correction and the treatment of unsubstantiated cases were not evaluated.

Possible consequence: A misleading assessment or disproportionate attention to an institution.

Assessment: High-priority explanation discrepancy plus a significant fairness risk. This is not proof of an actual adverse decision.

Required validation: Recalculate the displayed total and test one allegation appearing across multiple bureaus. Distinguish workload indicators from substantiated findings.

Register links: C02, C03; U07, U08, U14

J06 | Complaint evidence verification officer

Task: Establish what an attachment supports and what remains uncertain.

Observed evidence: Two complaint attachments were labelled Verified PDF. The inspected document view did not display the reviewer, verification method, scope or supporting source.

Human flaw: A valid file or authentic document can be mistaken for proof of the complete allegation.

Observed concern / interpretation: File validation, document authenticity, relevance and factual substantiation are different assessments.

Untested control: Underlying files, issuer confirmation, verification records, later versions and a disputed-document workflow were not tested.

Possible consequence: Premature acceptance or dismissal of a complaint based on an ambiguous badge.

Assessment: High evidence-interpretation concern in the inspected view.

Required validation: Require each verification badge to identify its scope and evidence. Test a readable but irrelevant file, an authentic but outdated document and a disputed submission.

Register links: C01; U03, U04, U05

08 / COMPLETE REVIEW REGISTER

Jury register: 07-08

Two stakeholder perspectives per page. Assessments are simulated and evidence-limited.

J07 | Bank / FDR document verification officer

Task: Confirm the exact financial instrument and the current information.

Observed evidence: FDR-Setu shows declared, AI-extracted and bank-confirmed fields. The bank module discloses simulation. Two displayed SHA-256 strings each had 63 hex characters; document previews repeated receipt-style particulars.

Human flaw: An officer may equate a matching table or checksum label with independent bank confirmation.

Observed concern / interpretation: Simulation, extraction agreement, authenticity and current bank position must remain distinguishable. The checksum display needs explanation.

Untested control: Real bank access, authenticated replies, actual file hashing and reply-to-version matching were not tested.

Possible consequence: An outdated or unsupported confirmation could be accepted as current.

Assessment: High verification-credibility concern. Display anomalies do not prove corrupted files or a broken cryptographic backend.

Required validation: Hash actual uploaded test bytes and compare a full digest. Submit replacement R2 before an R1 reply arrives; require R2 to remain unresolved.

Register links: F03, F05, F06; U03, U04, U05

J08 | Bureau case-handling officer

Task: Recognize genuine conflict with another bureau's actions.

Observed evidence: The complaint overlap explanation uses different statuses, such as Under Process and Escalated, as parallel/conflicting actions.

Human flaw: An officer may confuse different stages of handling with incompatible instructions.

Observed concern / interpretation: A coordination opportunity is not automatically a decision conflict. Both should be explained separately.

Untested control: Detection of genuinely incompatible instructions and recognition of compatible parallel work were not validated.

Possible consequence: Unnecessary coordination, avoidable delay or failure to recognize a real conflict.

Assessment: Observed overstatement in the explanation; actual matching accuracy remains untested.

Required validation: Compare status-only differences with genuinely incompatible decisions. Evaluate false alarms and missed conflicts separately.

Register links: C05; U07, U08

09 / COMPLETE REVIEW REGISTER

Jury register: 09-10

Two stakeholder perspectives per page. Assessments are simulated and evidence-limited.

J09 | Cross-bureau coordinator

Task: Coordinate related files while preserving original accountability.

Observed evidence: The portal offers side-by-side comparison, lead-bureau assignment, coordination threads, false-positive review and a combined Link & Merge Cases control.

Human flaw: A coordinator may consolidate separate complaints merely because they name the same institution.

Observed concern / interpretation: Related complaints can have different complainants, evidence and remedies. Lead assignment must not erase original responsibilities.

Untested control: Merge reversibility, original case preservation, coordination permissions, notification delivery and acceptance of ownership were not tested.

Possible consequence: Loss of evidence context, a forgotten complaint or ambiguous responsibility.

Assessment: Useful coordination structure with high-consequence consolidation risks requiring tests.

Required validation: Link two related cases and keep one unrelated case separate in an authorized sandbox. Verify original IDs, evidence, owners and decision histories remain traceable.

Register links: C06, C07; U08, U09, U11

J10 | Competent approving authority

Task: Authorize an action against current evidence and understand what follows.

Observed evidence: The FDR release view distinguishes approval stages and pending discharge, but also shows an order preview. The scrutiny workspace exposes technical transition choices.

Human flaw: An approver may confuse approval with issuance or execution, or rely on checks completed before a material change.

Observed concern / interpretation: The decision must state the current record, evidence version, prerequisites, authority and downstream responsibility.

Untested control: Server-enforced authorization, separate preparation/approval and rechecking after material changes were not tested.

Possible consequence: Premature authorization or an official-looking output that users mistake for an executed instruction.

Assessment: High-consequence control uncertainty; the existence of stages is useful but not proof of enforcement.

Required validation: Test each role against allowed and denied actions; alter a material field in a disposable test case and verify affected checks reopen.

Register links: F07, X02; U01, U04, U10, U11

10 / COMPLETE REVIEW REGISTER

Jury register: 11-12

Two stakeholder perspectives per page. Assessments are simulated and evidence-limited.

J11 | Finance, legal and vigilance reviewer

Task: Establish applicable conditions and independently supported financial completion.

Observed evidence: The FDR view has a payment/discharge-reference field and claims about statutory periods and timelines. Financial integrations are proposed or simulated.

Human flaw: An entered reference may be treated as reconciled completion; a configured period may be treated as a universal legal rule.

Observed concern / interpretation: Each rule needs an applicable source/version; approval, bank discharge and settlement require distinct evidence where relevant.

Untested control: Rule applicability, exception handling, settlement reconciliation, duplicate completion and changing holds were not tested.

Possible consequence: Incorrect release processing, unresolved recovery or misleading completion status.

Assessment: High consequence, with important policy and integration dependencies unresolved.

Required validation: Use verified policy scenarios and a financial test harness. Test missing confirmation, mismatched references, duplicates and an applicable unresolved hold.

Register links: F04, F07, F08; U05, U10, U11, U14

J12 | Auditor, security and accessibility reviewer

Task: Reconstruct decisions and assess safe use by different users.

Observed evidence: Both sites expose demo role switching and audit-related claims. FDR demo entry displayed a 2FA/authentication message. Dense tables, long names and nested scrolling are visible.

Human flaw: Users can mistake a role label for enforced access, an audit hash for truth, or an accessibility claim for tested usability.

Observed concern / interpretation: The evidence must distinguish actual controls from interface demonstrations. Critical tasks need testing across users and assistive technologies.

Untested control: Backend authorization, isolation, durable logs, recovery, keyboard/screen-reader/mobile use and actual authentication were not tested.

Possible consequence: Unauthorized action, incomplete accountability or exclusion of users who cannot operate the interface effectively.

Assessment: High control uncertainty. No penetration test or accessibility certification was performed.

Required validation: Run role and isolation tests, reconstruct a changed case from independent logs, and perform core tasks with keyboard, screen reader and narrow-screen layouts.

Register links: X01-X06; U01, U11-U16

11 / COMPLETE REVIEW REGISTER

Untested controls: 01-08

All entries below remain NOT RUN in this review. An interface label is not a pass result. Tests should use synthetic data and authorized disposable environments.

Test	Control	Required result	Evidence to retain
U01	Authorization and institution isolation	Each role can view and perform only permitted actions; direct requests are also denied.	Role matrix; allowed/denied results; server evidence.
U02	One-college assessment	Users correctly separate institution, obligation, instrument and case positions.	Task recording; selected IDs; correct answer sheet.
U03	Document authenticity and extraction	Readable, authentic, relevant and substantiated evidence are separately assessed.	Raw files; issuer/source records; extraction-error report.
U04	Version and stale-evidence handling	Late R1 confirmation cannot verify R2; only affected checks reopen after changes.	Versioned case log; before/after results.
U05	Real or manual bank verification	Authenticated source, instrument, scope, timestamp and uncertainty are retained.	Approved procedure; confirmed replies; timeout/mismatch cases.
U06	Privacy and safe disclosure	Necessary identity/attachments are restricted during cross-bureau coordination.	Synthetic identity tests; visibility matrix.
U07	Scores and explanations	Displayed totals reproduce exactly; score meaning and calibration are documented.	Independent calculations; labelled dataset; error analysis.
U08	Overlap, conflict and false positives	Related cases, duplicates and incompatible decisions are distinguished.	Independent labels; precision/recall; false-positive cases.

Interpretation

A successful test must identify the tested build, actor role, case/document version, input, expected result, actual result and supporting evidence. Passing a finite test set supports only the tested conditions. It does not establish universal reliability.

12 / COMPLETE REVIEW REGISTER

Untested controls: 09-16

All entries below remain NOT RUN in this review. An interface label is not a pass result. Tests should use synthetic data and authorized disposable environments.

Test	Control	Required result	Evidence to retain
U09	Coordination and case preservation	Lead ownership is accepted and originals remain independently traceable.	Assignment history; original IDs; merge/reversal outcomes.
U10	Policy applicability and release eligibility	Rules are versioned; exceptions/holds apply to the correct case.	Reviewed rule catalogue; expected case outcomes.
U11	Consequential actions and concurrency	Wrong-record, duplicate and concurrent actions cannot produce inconsistent outcomes.	Authorized sandbox tests; transaction/history evidence.
U12	Audit integrity and reconstruction	Source, actor, version, reason and consequential changes are reconstructable.	Persistent logs; independent comparison; recovery test.
U13	Usability and accessibility	New/occasional users complete critical tasks across relevant input/display modes.	Task success/errors; keyboard/screen-reader/mobile findings.
U14	Appeal, correction and fairness	Incorrect identity matches, adverse interpretations and disputed evidence can be reviewed.	Correction history; response and reopening scenarios.
U15	Persistence, outages and recovery	Work survives refresh/restart appropriately; interrupted actions recover consistently.	Restart/timeout tests; backup restore; status reconciliation.
U16	Authentication and operational integrations	Actual authentication and notifications are distinguished from simulations.	Login/session evidence; delivery receipts; connector test results.

Interpretation

A successful test must identify the tested build, actor role, case/document version, input, expected result, actual result and supporting evidence. Passing a finite test set supports only the tested conditions. It does not establish universal reliability.

Explicit limits of this review

- No uploads, edits, approvals, merges, complaint dispositions, notifications or financial actions were performed.

- No source-code review, penetration test, production-bank connection, legal certification or formal accessibility audit was performed.

- No timed user study was performed; cognitive-load conclusions are expert inspection judgments.

13 / COMPLETE REVIEW REGISTER

Task validation and priority register

Recommendations are report-only. They do not authorize changes to either website or live data.

Task A - assess one college

Procedure: Search the institution; verify its ID; explain separate obligations/instruments or complaints; identify current evidence, blockers and owners.
Acceptance: The user identifies the right institution, distinguishes case status from institution status, and states a correct next action without guessing.

Task B - resolve one FDR discrepancy

Procedure: Use a disposable R1/R2 replacement scenario. Deliver an R1 bank response after R2 is submitted.
Acceptance: R1 evidence does not silently verify R2; the affected action remains blocked with a clear reason and history.

Task C - assess one complaint

Procedure: Compare a true related pair, an unrelated same-college pair and a status-only difference. Inspect evidence and coordination.
Acceptance: The system distinguishes relation, duplication, coordination and actual conflict; individual records and ownership remain traceable.

Priority	Items	Required decision before relying on the result
P1 - first	F02; C02	Resolve wrong-record context and reconcile the displayed score explanation.
P1 - high consequence	F03, F07, C01, C04, C06	Establish verification scope, permissions, privacy and preservation of original cases.
P2 - credibility	F05, F06, F08, C05, C07, C08	Explain document integrity, policy sources, simulation figures, matching scores and seed consistency.
P2 - usability	F01, F04; X01-X06	Validate college/case tasks with new and occasional users, including accessibility checks.

Measures to collect

Task success; wrong-record selections; skipped prerequisites; help requests; user interpretation of verification/score labels; active handling time; elapsed time separately; false positives; false negatives; denied unauthorized actions; successful recovery. No achieved values are claimed here.

14 / COMPLETE REVIEW REGISTER

Evidence, handoff and final assessment

Sources and observation scope

1. https://fdr-setu.ai.studio/
Reviewed views: demo entry, command centre, scrutiny workspace, institution filtering, declared/AI/bank comparison, document previews, bank simulation, release workflow and proposed architecture. The displayed system clock was 24-Oct-2026 during the 25-Oct-2026 review.

2. Complaint portal - case register
Reviewed views: case register, individual dossiers, document labels, institution directory/profile, overlap comparisons, coordination controls and false-positive example. The site explicitly labels its dataset as dummy data.

3. NIST FIPS 180-4 - Secure Hash Standard
SHA-256 produces a 256-bit digest. A conventional full-width hexadecimal encoding therefore contains 64 characters (256 / 4). The two displayed values were counted from visible page text; actual file bytes were not verified.

Reproduction notes

- **F02:** Scrutiny Workspace - filter Pragati - filter Kalinga - compare result list with the retained FDR-2026-0001/Pragati detail header. No action was submitted.

- **C02:** Institutions 360 - open the inspected Sri Venkateswara demo profile - compare total 100/100 with contributions 30, 24, 20, 12 and 10. A missing term could explain the mismatch; investigate before declaring an algorithm defect.

- **F05:** Selected FDR-2026-0001 - Documents (2) - read both displayed checksum strings. Each contained 63 hexadecimal characters. The conclusion is limited to the display.

Handoff record for website heads

For each item retain: issue/test ID; responsible owner; build/version; affected task; evidence; expected behaviour; actual behaviour; proposed response; retest result; residual risk; reviewer and date. Current status for observed issues is OPEN; untested controls remain NOT RUN. No remediation or pass status is implied.

Final assessment: both sites provide substantial demonstrations. The complaint institution profile already helps consolidate a college assessment. FDR-Setu has useful evidence distinctions but a reproduced record-context hazard. Neither interface review establishes that the applications reliably prevent ordinary human mistakes or enforce all consequential controls.

The governing acceptance question

Can an authorized officer identify the correct institution and case, understand what is actually verified, see the current blocker and next owner, and act without relying on an unsupported label or outdated record?
